## DTK301 - MULTI FUNCTION TESTER KIT

Model No : **DTK301**

This Multi-Function Test Kit is an indispensable test kit for Motor Mechanics while diagnosing DC12V or DC24V electrical circuit or component faults in the vehicle. The set contains the Function Tester, Current Drain Indicator Lamp and many other essential test aids needed for checking components, tracing faults, or fixing complex vehicle circuitry.

The main unit -Function Tester (Power Probe) can perform Polarity Test on the circuit Positive (Red LED will light) or Negative (Green LED will light), Conductivity Test (Open Circuit Test e.g. broken contact), Component activation (e.g. Light bulb, radiator fan, cooling fan, air-condition magnetic clutch, fuel pump, blower, solenoid, etc.) using battery power supplied directly to the component when it has been disconnected or taken out from the circuit for checking, Components activation using positive (+) supply directly to the component (+) when its positive side has been disabled from the circuit or using negative (-) supply directly to the component (-) when its negative side has been disabled from the circuit and also able to check the orientation of the lamps circuit at the plug during Lamp test on a trailer.

Besides, the kit comprises various attachments and connecting cables to cater for a variety of test that can be conducted with other tester or instruments.
